Branch: Mathematics & Computing (2024 batch)

Given code file attached separately for calendar.cpp, in which I try to make a calendar for Sept of september and add an event at some date in the calendar, while adding the event following line(line no. 116) is getting called:

`Sept.addEvent(date, event1);`

where, “Sept” is object for september month,

“addEvent” is function or method of the “Sept” object

“date” is int variable containing date

“event1” is an event object

and I can see in disassembly view following instruction on registers are being processed:

0x0000000000000082	48 8d 95 e0 fe ff ff	lea	rdx, [rbp-0x120]
0x0000000000000089	48 8d 85 20 ff ff ff	lea	rax, [rbp-0xe0]
0x0000000000000090	48 89 d6	mov	rsi, rdx
0x0000000000000093	48 89 c7	mov	rdi, rax
0x0000000000000096	e8 39 0a 00 00	call	0x55555557ad4 <_ZN5EventC2ERKS_>
0x000000000000009b	8b 8d 7c fe ff ff	mov	ecx, DWORD PTR [rbp-0x184]
0x00000000000000a1	48 8d 95 20 ff ff ff	lea	rdx, [rbp-0xe0]
0x00000000000000a8	48 8d 85 60 ff ff ff	lea	rax, [rbp-0xa0]
0x00000000000000af	89 ce	mov	esi, ecx
0x00000000000000b1	48 89 c7	mov	rdi, rax
0x00000000000000b4	e8 cd f9 ff ff	call	0x55555556a86 <_ZN13monthCalendar8addEventEi5Event>
0x00000000000000b9	48 8d 85 20 ff ff ff	lea	rax, [rbp-0xe0]
0x00000000000000c0	48 89 c7	mov	rdi, rax
0x00000000000000c3	e8 dc 09 00 00	call	0x55555557aa4 <_ZN5EventD2Ev>

Fig.1: Disassembly lines corresponding to code on line no. 116 as given before

Line by line brief about above lines of instructions on registers are as follows:

1. lea rdx, [rbp-0x120]:
 - Calculates an address to be used, possibly for storing the 'Event' object, and stores it in 'rdx'.
2. lea rax, [rbp-0xe0]:
 - Likely computes an address related to the 'unordered_map' within the 'Sept' object, and stores it in 'rax'.
3. mov rsi, rdx:
 - Copies the address calculated in step 1 to 'rsi', possibly preparing it for a function call.
4. mov rdi, rax:
 - Copies the address calculated in step 2 to 'rdi', likely preparing it for a function call.

5. call 0x55555557ad4 <_ZN5EventC2ERKS_>:
 - Calls a constructor, possibly for an 'Event' object. It may be related to creating an event to be inserted into the 'unordered_map'.
6. mov ecx, DWORD PTR [rbp-0x184]:
 - Retrieves a 32-bit value from memory, possibly for further operations.
7. lea rdx, [rbp-0xe0]:
 - Recalculates an address related to the 'unordered_map'.
8. lea rax, [rbp=0xa0]:
 - Calculates an address, possibly related to the 'Sept' object.
9. mov esi, ecx:
 - Copies the value retrieved earlier into 'esi', likely preparing it for a function call.
10. mov rdi, rax:
 - Copies the address calculated in step 8 to 'rdi', possibly preparing it for a function call.
11. call 0x555555556a86 <_ZN13SeptCalendar8addEventEi5Event>:
 - Calls a function, possibly for adding an event to the 'unordered_map' within the 'Sept' object.
12. lea rax, [rbp-0xe0]:
 - Recalculates an address related to the 'unordered_map'.
13. mov rdi, rax:
 - Copies the address calculated in step 12 to 'rdi', likely preparing it for a function call.
14. call 0x55555555aa4 <_ZN5EventD2Ev>:
 - Calls a destructor, possibly for the 'Event' object that was created earlier.

And final memory address that I obtained using '&' operator on variable holding event in 'Sept' object is: 0x555555576ec0
where, 0x555555576ec0 is a memory address in hexadecimal notation. It represents a location in the computer's memory where the **Event** object is finally stored.
